

Abstract

METHOD AND SYSTEM FOR PROVIDING POWER AND SIGNALS IN AN  
AUDIO/VIDEO SECURITY SYSTEM

5       The invention provides a system and method for processing one or more  
audio/video sources for connection to a video monitor and speaker, utilizing a single  
coaxial cable between each remotely located audio/video source and a processing means.  
It provides a simultaneous or sequential display of one or more remotely located video  
sources and annunciation of one or more remotely located audio sources. The processing  
10       means and the audio/video sources include a splitter and combiner to separate and  
combine, respectively, an audio/video modulated carrier from DC power. The processing  
means and the video source may contain a switch for selecting power from the coaxial  
cable or from a local power source. By requiring only a single coaxial cable between each  
video source and the processing means, cable installation is greatly simplified.
